☆ Buy Top-Size Bulbs for the BEST Results

Don't be confused by offers of "blooming size" bulbs at "bargain prices." It takes two dozen small bulbs planted 6 inches apart to approach the effect of **only a dozen top-size bulbs** planted 1 foot apart. Large bulbs cannot be crowded. They grow naturally into large bushy plants with more and larger flowers. Twelve years' experience planting bulbs in our Bulb Gardens at Niles have shown that we save money by planting the best.

HOW TO SUCCEED WITH ANEMONES and RANUNCULUS

Rainy winters impress the necessity for good drainage in beds planted to anemones and ranunculus. They will not grow in soil saturated from heavy rainfall, but will reward us with countless flowers if we are careful in planting. Raise the soil level in beds devoted to these flowers so that when planted the bulbs will be above the surface level of surrounding terrain. Soak bulbs for one hour before planting; plant Oct.-Dec. at depth of 2 to 3 inches, with small "prongs" down.

HOW TO GROW BULBS....

GENERAL: Dig soil deeply, adding peat generously. If manure is used it should be thoroughly rotted and placed below the point where bulbs are set, or added as a mulch after planting. Do not cut foliage until bulbs are completely ripened.

DAFFODILS: See accompanying chart for depth. Plant from late September to December. Water thoroughly after planting if soil is dry. Water for a month after blooming, then allow to dry. Remove foliage when dry and cultivate top soil. Mulch with peat if bulbs are in full sun. Bulbs may be left in ground three to five years or more, or until crowded. Plant 8-12 inches apart.

TULIPS: See chart for planting depth. Loose, **well-drained** soil is essential. Place **handful of clean sand under each bulb** as planted. Do not allow soil to dry out, especially after growth shows above soil surface. Do not plant too early. Late October to early December is best. In shaded gardens bulbs may remain in soil but in sunny gardens, dig bulbs as soon as foliage is ripe, dry carefully in shade and store in ventilated containers. Plant 6-8 inches apart.

DUTCH IRIS: Plant 3 inches deep in any good soil. Leave 5 or 6 blades of foliage when cutting blooms for indoor use. Bulbs may be dug and divided each year or left in soil. Plant 6-8 in. apart.

FREESIAS, IXIAS, TRITONIAS, BABIANAS, SPARAXIS, MORAEAS and BABY GLADIOLUS: Plant early in light, well drained soil in full sun. Keep soil moderately moist until rains begin. Bulbs may be left in soil for several years or dug each year after foliage is ripened, and stored in dry, ventilated containers. Plant 6-8 inches apart.

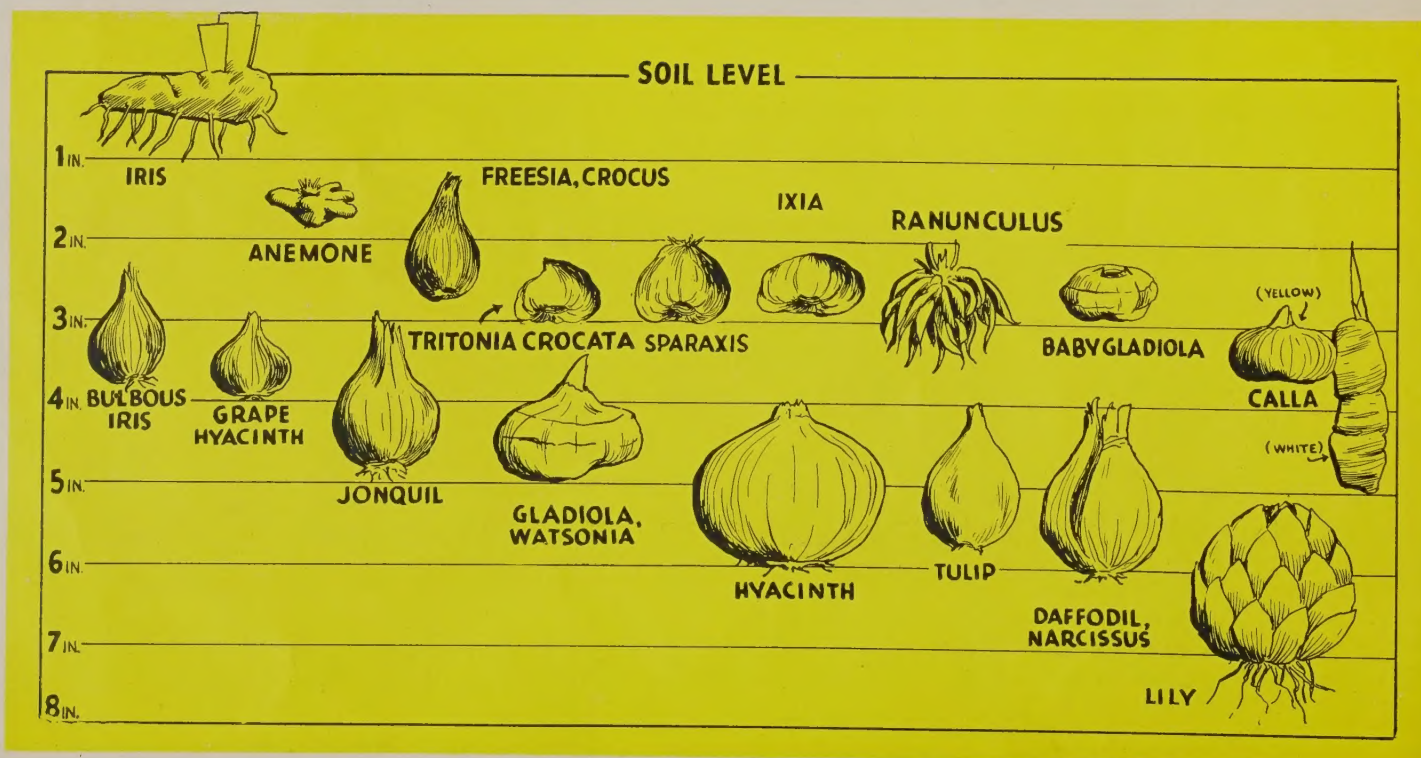

SCILLAS: Plant in moderate shade. Leave bulbs in soil for two or three years before lifting.

MUSCARI: Plant in full sun or light shade (October and early November). Lift and divide every three years for best results. Plant Muscari and Scillas 6-8 inches apart.
